# MODIFIED GENERAL TRANSFER MATRIX METHOD FOR LINEAR ROTOR BEARING SYSTEMS 

B B Maharathi ${ }^{1}$, R R Dash ${ }^{1}$ and $T$ Rout $^{1}$<br>${ }^{1}$ Department of Mechanical Engineering, IGIT, Sarang<br>769 146, Dhenkanal, Orissa, India<br>bbmaharathi@yahoo.com

#### Abstract

A modified general transfer matrix method is developed for the steady state response analysis of linear flexible rotor-bearing systems in the frequency domain with fixed matrix size. In this paper, the modifications of the transfer matrix method based on Timoshenko Beam Theory are derived from the concept of continuous systems instead of the conventional lumped system concept and the paper tries to extend the transfer matrix method to fit a synchronous elliptical orbit and a non-synchronous multi-lobed whirling orbit. To demonstrate the applicability of this method, a three-disk rotor-bearing system is used as a physical model in the numerical analysis.

## 1. INTRODUCTION

Dynamic characteristics of rotor-bearing systems are obtained by various methods such as; transfer matrix method (Lumped system and continuous system), finite element technique and dynamic stiffness method considering different influencing parameters related to rotor, disk and bearings [1-5]. In this work, an attempt has been made to formulate the general transfer matrix method based on continuous system model and superimposed of vibrations of the shaft in both the plains for dynamic response and critical speed of rotor systems.

## 2. TRANSFER MATRIX OF SHAFT

The elastic relations of the shaft element based on Timoshenko beam theory as shown in Figs. $1 \& 2$ are given as follows :

In the X-Z plane;

$$
\begin{align*}
& \frac{\partial^{4} X}{\partial Z^{4}}-\left(\frac{\rho}{K_{s} G}+\frac{\rho}{E I}\right) \frac{\partial^{4} X}{\partial Z^{2} \partial t^{2}}+\frac{\rho^{2}}{K_{s} G E} \frac{\partial^{4} X}{\partial t^{4}}+\frac{\rho A}{E I} \frac{\partial^{2} X}{\partial t^{2}}-\frac{2 \rho \omega}{E}\left(\frac{\partial^{3} Y}{\partial Z^{2} \partial t}-\frac{\rho}{K_{s} G} \frac{\partial^{3} Y}{\partial t^{3}}\right)-\frac{P}{E I} \frac{\partial^{2} X}{\partial Z^{2}} \\
& -\frac{T \rho}{\text { IIK }_{s} G} \frac{\partial^{3} Y}{\partial Z \partial t^{2}}+\frac{T}{E I} \frac{\partial^{3} Y}{\partial Z^{3}}=0 \tag{1a}
\end{align*}
$$

Figure 1. A rotating shaft element.

Figure 2. Geometries of shaft and disk unbalance.

In the $\mathrm{X}-\mathrm{Y}$ plane;
$\frac{\partial^{4} Y}{\partial Z^{4}}-\left(\frac{\rho}{K_{s} G}+\frac{\rho}{E I}\right) \frac{\partial^{4} Y}{\partial Z^{2} \partial t^{2}}+\frac{\rho^{2}}{K_{s} G E} \frac{\partial^{4} Y}{\partial t^{4}}+\frac{\rho A}{E I} \frac{\partial^{2} Y}{\partial t^{2}}+\frac{2 \rho \omega}{E}\left(\frac{\partial^{3} X}{\partial Z^{2} \partial t}-\frac{\rho}{K_{s} G} \frac{\partial^{3} X}{\partial t^{3}}\right)-\frac{P}{E I} \frac{\partial^{2} Y}{\partial Z^{2}}$
$+\frac{T \rho}{\operatorname{EIK}_{s} G} \frac{\partial^{3} X}{\partial Z \partial t^{2}}-T \frac{\partial^{3} X}{\partial Z^{3}}=0$
Since the whirling orbit is elliptical and synchronous $(\Omega=w)$ as shown in Fig.3, the steady state solutions can be written as;

$$
\begin{equation*}
\mathrm{X}(\mathrm{z}, \mathrm{t})=\mathrm{X}_{\mathrm{C}}(\mathrm{t}) \cos \Omega \mathrm{t}+\mathrm{X}_{\mathrm{S}}(\mathrm{t}) \sin \Omega \mathrm{t}, \quad \mathrm{Y}(\mathrm{z}, \mathrm{t})=\mathrm{Y}_{\mathrm{C}}(\mathrm{t}) \cos \Omega \mathrm{t}+\mathrm{Y}_{\mathrm{S}}(\mathrm{t}) \sin \Omega \mathrm{t} \tag{2}
\end{equation*}
$$

where, $X_{C}, X_{S}, Y_{C}, Y_{S}$ are mode functions. Introducing $\bar{X}=X_{C}+j X_{S}$ and $\bar{Y}=Y_{C}+j Y_{S}$, the general solutions can be written as;

$$
\overline{\mathrm{X}}(\mathrm{z})=\mathrm{U}_{\mathrm{C}} \mathrm{e}^{\lambda \mathrm{z}}+\mathrm{jU}_{\mathrm{S}} \mathrm{e}^{\lambda \mathrm{z}} \quad \text { and } \quad \overline{\mathrm{Y}}(\mathrm{z})=\mathrm{V}_{\mathrm{C}} \mathrm{e}^{\lambda \mathrm{z}}+\mathrm{jV}_{\mathrm{S}} \mathrm{e}^{\lambda \mathrm{z}} .
$$

$\mathrm{U}_{\mathrm{C}}, \mathrm{U}_{\mathrm{S}}, \mathrm{V}_{\mathrm{C}}, \mathrm{V}_{\mathrm{S}}$ are real constants and $\lambda$ is the characteristic value with respect to a specific natural mode. Separating real and imaginary parts, it yields as;

$$
\begin{align*}
& \left(\lambda^{4}+\mathrm{f}_{\mathrm{f}} \lambda^{2}+\mathrm{g}\right) \mathrm{U}_{\mathrm{c}}+\left[-\left(\mathrm{h} \lambda^{2}+\mathrm{k}\right)+\mathrm{j}\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)\right] \mathrm{V}_{\mathrm{S}}=0 \\
& \mathrm{j}\left(\lambda^{4}+\mathrm{f}_{1} \lambda^{2}+\mathrm{g}\right) \mathrm{U}_{\mathrm{s}}+\left[\mathrm{j}\left(\mathrm{~h} \lambda^{2}+\mathrm{k}\right)+\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)\right] \mathrm{V}_{\mathrm{C}}=0 \\
& {\left[\left(\mathrm{~h} \lambda^{2}+\mathrm{k}\right)-\mathrm{j}\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)\right] \mathrm{U}_{\mathrm{s}}+\left(\lambda^{4}+\mathrm{f}_{\mathrm{l}} \lambda^{+g}\right) \mathrm{V}_{\mathrm{C}}=0} \\
& {\left[-\mathrm{j}\left(\mathrm{~h} \lambda^{2}+\mathrm{k}\right)-\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)\right] \mathrm{U}_{\mathrm{C}}+\mathrm{j}\left(\lambda^{4}+\mathrm{f}_{\mathrm{l}} \lambda^{2}+\mathrm{g}\right) \mathrm{V}_{\mathrm{S}}=0} \tag{3}
\end{align*}
$$

Since $U_{C}, U_{S}, V_{C}, V_{S}$ being non-trival, the characteristic equation can be obtained by setting the determinant of Eq. (3) to zero. It yields as;

$$
\begin{equation*}
\left\{\left(\lambda^{4}+\mathrm{f}_{1} \lambda^{2}+\mathrm{g}\right)+\left[\mathrm{j}\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)-\left(\mathrm{h} \lambda^{2}+\mathrm{k}\right)\right]\right\}^{2} \cdot\left\{\left(\lambda^{4}+\mathrm{f}_{1} \lambda^{2}+\mathrm{g}\right)-\left[\mathrm{j}\left(\lambda^{3}+\mathrm{d} \lambda\right)-\left(\mathrm{h} \lambda^{2}+\mathrm{k}\right)\right]\right\}^{2}=0 \tag{4}
\end{equation*}
$$

where, $f_{1}=\left(\frac{\rho \omega^{2}}{E}\right)+\left(\frac{\rho \omega^{2}}{K_{S} G}\right)-\frac{P}{E I}, \quad g=\left(\frac{\rho^{2} \omega^{4}}{K_{S} G E}\right)-\left(\frac{\rho A \omega^{2}}{E I}\right)$

$$
\mathrm{h}=\frac{2 \rho \omega^{2}}{\mathrm{E}}, \mathrm{k}=\frac{2 \rho^{2} \omega^{4}}{\mathrm{~K}_{S} G E}, \quad \mathrm{c}=\frac{\mathrm{T}}{\mathrm{EI}}, \mathrm{~d}=\frac{\mathrm{T} \rho \omega^{2}}{\mathrm{~K}_{S} G E I}
$$

By separating Eq. (4) into two parts as follows :

$$
\left\{\begin{array}{l}
\left\{\left(\lambda^{4}+\mathrm{f}_{1} \lambda^{2}+\mathrm{g}\right)+\left[\mathrm{j}\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)-\left(\mathrm{h} \lambda^{2}+\mathrm{k}\right)\right]\right\}^{2}=0 \\
\left\{\left(\lambda^{4}+\mathrm{f}_{1} \lambda^{2}+\mathrm{g}\right)-\left[\mathrm{j}\left(\mathrm{c} \lambda^{3}+\mathrm{d} \lambda\right)-\left(\mathrm{h} \lambda^{2}+\mathrm{k}\right)\right]\right\}^{2}=0 \tag{5b}
\end{array}\right.
$$

The four complex roots of Eq. (5a) are $\lambda_{i}=a_{i}+j b_{i}$ for $i=1 \sim 4$ and other four complex roots of Eq. 5(b) are $\lambda_{i}=a_{i}+j b_{i}$ for $i=5 \sim 8$.

For $\lambda_{i}=a_{i}+j b_{i}, i=1 \sim 4, U_{C}=V_{S}, U_{S}=-V_{C}$
For $\lambda_{i}=a_{i}+j b_{i}, i=5 \sim 8, U_{C}=-V_{S}, U_{S}=V_{C}$
Thus, the four homogeneous solutions are as follows :
where,
$A_{i}$ and $B_{i}$ are real constants ( $\mathrm{i}=1 \sim 8$ ).
Differentiating Eq. (6) with respect to z and substituting $\mathrm{Z}=0$, it becomes

$$
[\mathrm{W}(\mathrm{Z}=0)]=[\mathrm{M}]_{17 \times 17}\left[\begin{array}{l}
\mathrm{A}  \tag{7}\\
\mathrm{~B} \\
1
\end{array}\right]_{17 \times 1}
$$

where,

$$
\begin{aligned}
& {[\mathrm{W}(\mathrm{Z}=0)]=\left[\mathrm{X}_{\mathrm{C}}(0), \mathrm{X}_{\mathrm{S}}(0), \mathrm{Y}_{\mathrm{C}}(0), \mathrm{Y}_{\mathrm{S}}(0), 1\right]^{\mathrm{t}}} \\
& \mathrm{X}_{\mathrm{C}}=\left[\mathrm{X}_{\mathrm{C}}, \mathrm{X}_{\mathrm{C}}^{\prime}, \mathrm{X}_{\mathrm{C}}^{\prime \prime}, \mathrm{X}_{\mathrm{C}}^{\prime \prime \prime}\right]^{\mathrm{t}}, \mathrm{X}_{\mathrm{S}}=\left[\mathrm{X}_{\mathrm{S}}, \mathrm{X}_{\mathrm{S}}^{\prime}, \mathrm{X}_{\mathrm{S}}^{\prime \prime}, \mathrm{X}_{\mathrm{S}}^{\prime \prime \prime}\right]^{\mathrm{t}} \\
& \mathrm{Y}_{\mathrm{C}}=\left[\mathrm{Y}_{\mathrm{C}}, \mathrm{Y}_{\mathrm{C}}^{\prime}, \mathrm{Y}_{\mathrm{C}}^{\prime \prime}, \mathrm{Y}_{\mathrm{C}}^{\prime \prime \prime}\right]^{\mathrm{t}}, \quad \mathrm{Y}_{\mathrm{S}}=\left[\mathrm{Y}_{\mathrm{S}}, \mathrm{Y}_{\mathrm{S}}^{\prime}, \mathrm{Y}_{\mathrm{S}}^{\prime \prime}, \mathrm{Y}_{\mathrm{S}}^{\prime \prime \prime}\right]^{\mathrm{t}}
\end{aligned}
$$

$$
\mathrm{A}=\left[\mathrm{A}_{1}, \mathrm{~A}_{2}, \mathrm{~A}_{3}, \mathrm{~A}_{4}, \mathrm{~A}_{5}, \mathrm{~A}_{6}, \mathrm{~A}_{7}, \mathrm{~A}_{8}\right]^{\mathrm{t}}, \quad \mathrm{~B}=\left[\mathrm{B}_{1}, \mathrm{~B}_{2}, \mathrm{~B}_{3}, \mathrm{~B}_{4}, \mathrm{~B}_{5}, \mathrm{~B}_{6}, \mathrm{~B}_{7}, \mathrm{~B}_{8}\right]^{\mathrm{t}}
$$

$t=$ transpose of the array.

$$
\left[\begin{array}{l}
\mathrm{A}  \tag{8}\\
\mathrm{~B} \\
1
\end{array}\right]=[\mathrm{M}]_{17 \times 17}^{-1}[\mathrm{~W}(\mathrm{z}=0)]
$$

At $\mathrm{Z}=\mathrm{L}$,

$$
[\mathrm{W}(\mathrm{Z}=\mathrm{L})]=[\mathrm{H}]_{17 \times 17}\left[\begin{array}{c}
\mathrm{A}  \tag{9}\\
\mathrm{~B} \\
1
\end{array}\right]
$$

where, $\left[\mathrm{W}(\mathrm{Z}=\mathrm{L}]=\left[\mathrm{X}_{\mathrm{C}}(\mathrm{L}), \mathrm{X}_{\mathrm{S}}(\mathrm{L}), \mathrm{Y}_{\mathrm{C}}(\mathrm{L}), \mathrm{Y}_{\mathrm{S}}(\mathrm{L})\right]^{\mathrm{t}}\right.$
Now,

$$
\begin{equation*}
[\mathrm{W}(\mathrm{Z}=\mathrm{L})]=[\mathrm{H}]_{17 \times 17}[\mathrm{M}]_{17 \times 17}^{-1}[\mathrm{~W}(\mathrm{Z}=0)]=[\mathrm{N}]_{17 \times 17}[\mathrm{~W}(\mathrm{Z}=0)] \tag{10}
\end{equation*}
$$

$$
\begin{align*}
& X_{C}(Z)=\sum_{i=1}^{4} A_{i} e^{a_{i} Z} \cos b_{i} Z+\sum_{i=5}^{8} A_{i} e^{a_{i} Z} \cos b_{i} Z-\sum_{i=1}^{4} B_{i} e^{a_{i} Z} \sin b_{i} Z+\sum_{i=5}^{8} B_{i} e^{a_{i} Z} \sin b_{i} Z \\
& X_{s}(Z)=\sum_{i=1}^{4} A_{i} e^{a_{i} Z} \sin b_{i} Z+\sum_{i=5}^{8} A_{i} e^{a_{i} Z} \sin b_{i} Z+\sum_{i=1}^{4} B_{i} e^{a_{i} Z} \cos b_{i} Z-\sum_{i=5}^{8} B_{i} e^{a_{i} Z} \cos _{i} Z \\
& Y_{C}(Z)=-\sum_{i=1}^{4} A_{i}{ }^{a_{i} Z} \sin b_{i} Z+\sum_{i=5}^{8} A_{i} e^{a_{i} Z} \sin b_{i} Z-\sum_{i=1}^{4} B_{i} e^{a_{i} Z} \cos b_{i} Z-\sum_{i=5}^{8} B_{i} e^{a_{i} Z} \cos b_{i} Z \\
& Y_{S}(Z)=\sum_{i=1}^{4} A_{i} e^{a_{i} Z} \cos b_{i} Z-\sum_{i=5}^{8} A_{i} e^{a_{i} Z} \cos b_{i} Z-\sum_{i=1}^{4} B_{i} e^{a_{i} Z} \sin b_{i} Z-\sum_{i=5}^{8} B_{i} e^{a_{i} Z} \sin b_{i} Z \tag{6}
\end{align*}
$$

The state variables can be written as;

$$
\begin{align*}
& \bar{X}=X_{C}+j X_{S}, \quad \overline{X^{\prime}}=\bar{\alpha}-\frac{\bar{Q}_{X}}{K_{S} G E}, \quad \bar{X} "=\left(1-\frac{P}{K_{S} G E}\right) \frac{\bar{M}_{X}}{E I}-\frac{\rho \omega^{2}}{K_{S} G} \bar{X} \\
& \bar{X}^{\prime \prime}=\left(-C_{f} \rho I \omega^{2}-\frac{\rho \omega^{2}}{K_{S} G}\right) \bar{\alpha}-j 2 C_{f} \rho I \omega^{2} \bar{\beta}+\left[C_{f}+\frac{\rho \omega^{2}}{K_{S}^{2} G^{2} A}\right] \bar{Q}_{X}-\frac{C_{f} T}{E I} \bar{M}_{X} \tag{11a}
\end{align*}
$$

and, $\overline{\mathrm{Y}}=\mathrm{Y}_{\mathrm{C}}+j \mathrm{Y}_{\mathrm{S}}, \quad \overline{\mathrm{Y}}^{\prime}=\beta-\frac{\overline{\mathrm{Q}}_{\mathrm{y}}}{\mathrm{K}_{\mathrm{S}} \mathrm{GE}}, \quad \overline{\mathrm{Y}}=\left(1-\frac{\mathrm{P}}{\mathrm{K}_{\mathrm{S}} \mathrm{GE}}\right) \frac{\overline{\mathrm{M}}_{\mathrm{y}}}{\mathrm{EI}}-\frac{\rho \omega^{2}}{\mathrm{~K}_{\mathrm{S}} G} \overline{\mathrm{Y}}$

$$
\begin{equation*}
\bar{Y}^{\prime \prime \prime}=\left(-C_{f} \rho I \omega^{2}-\frac{\rho \omega^{2}}{K_{s} G}\right) \bar{\beta}-j 2 C_{f} \rho I \omega^{2} \bar{\alpha}+\left[C_{f}+\frac{\rho \omega^{2}}{K_{S}^{2} G^{2} A}\right] \bar{Q}_{y}+\frac{C_{f} T}{E I} \bar{M}_{y} \tag{11b}
\end{equation*}
$$

where, $\mathrm{C}_{\mathrm{f}}=\frac{\left(\mathrm{K}_{\mathrm{S}} \mathrm{GA}-\mathrm{P}\right)}{\mathrm{EIK}_{\mathrm{S}} \mathrm{GA}}$
Further, the state vectors can be written as;
$\overline{\mathrm{X}}=\mathrm{X}_{\mathrm{C}}+\mathrm{j} \mathrm{X}_{\mathrm{S}}, \quad \overline{\mathrm{Y}}=\mathrm{Y}_{\mathrm{C}}+\mathrm{j} \mathrm{Y}_{\mathrm{S}}, \quad \bar{\alpha}=\alpha_{\mathrm{c}}+\mathrm{j} \alpha_{\mathrm{S}}, \quad \bar{\beta}=\beta_{\mathrm{c}}+\mathrm{j} \beta_{\mathrm{S}}$
$\bar{M}_{X}=M_{X C}+j M_{X S}, \quad \bar{M}_{Y}=M_{Y C}+j M_{Y S}$
$\bar{Q}_{X}=M_{X C}+j Q_{X S}, \quad \bar{Q}_{Y}=Q_{Y C}+j Q_{Y S}$
Combining Eqs. (11) and (12) and separating real and imaginary terms, it yields as;

$$
\begin{equation*}
[\mathrm{W}(\mathrm{Z}=\mathrm{L})]_{17 \times 1}=[\mathrm{A}]_{17 \times 17}\left[\mathrm{~S}_{1}\right]_{17 \times 1} \tag{13}
\end{equation*}
$$

where,

$$
\begin{align*}
& {[\mathrm{W}(\mathrm{Z}=\mathrm{L})]=\left\{\mathrm{X}_{\mathrm{C}}, \mathrm{X}_{\mathrm{C}}^{\prime}, \mathrm{X}_{\mathrm{C}}^{\prime \prime}, \mathrm{X}_{\mathrm{C}}^{\prime \prime \prime}, \mathrm{X}_{\mathrm{S}}, \mathrm{X}_{\mathrm{S}}^{\prime}, \mathrm{X}_{\mathrm{S}}^{\prime \prime}, \mathrm{X}_{\mathrm{S}}^{\prime \prime \prime}, \mathrm{Y}_{\mathrm{C}}, \mathrm{Y}_{\mathrm{C}}^{\prime}, \mathrm{Y}_{\mathrm{C}}^{\prime \prime}, \mathrm{Y}_{\mathrm{C}}^{\prime \prime \prime}, \mathrm{Y}_{\mathrm{S}}, \mathrm{Y}_{\mathrm{S}}^{\prime}, \mathrm{Y}_{\mathrm{S}}^{\prime \prime}, \mathrm{Y}_{\mathrm{S}}^{\prime \prime \prime}, 1\right\}^{\mathrm{t}}} \\
& {[\mathrm{~s}]=\left\{\mathrm{X}_{\mathrm{C}}, \mathrm{X}_{\mathrm{S}}, \mathrm{Y}_{\mathrm{C}}, \mathrm{Y}_{\mathrm{S}}, \alpha_{\mathrm{C}}, \alpha_{\mathrm{S}}, \beta_{\mathrm{C}}, \beta_{\mathrm{S}}, \mathrm{M}_{\mathrm{XC}}, \mathrm{M}_{\mathrm{XS}}, \mathrm{M}_{\mathrm{YC}}, \mathrm{M}_{\mathrm{YS}}, \mathrm{Q}_{\mathrm{XC}}, \mathrm{Q}_{\mathrm{XS}}, \mathrm{Q}_{\mathrm{YC}}, \mathrm{Q}_{\mathrm{YS}}, 1\right\}^{\ell t}} \tag{14}
\end{align*}
$$

At $\mathrm{Z}=0,[\mathrm{~W}(\mathrm{Z}=0)]=[\mathrm{A}]\left\{\mathrm{S}_{0}\right\}_{17 \times 1}$
Combining Eqs. (13) and (14), it yields

$$
\begin{equation*}
\left\{\mathrm{S}_{\mathrm{i}}\right\}_{17 \times 1}=[\mathrm{A}]^{-1}[\mathrm{~N}][\mathrm{A}]\left\{\mathrm{S}_{0}\right\}_{17 \times 1}=[\mathrm{T}]_{17 \times 17}\left[\mathrm{~S}_{0}\right]_{17 \times 1} \tag{15}
\end{equation*}
$$

where, $[\mathrm{T}]_{17 \times 17}$ is the transfer matrix of the rotor segment $(\mathrm{Z}=\mathrm{L})$.

## 3. TRANSFER MATRIX OF THE DISK

The equilibrium condition, the relations of the state variables between the right and left side of an unbalanced disk is expressed as [1-4];

$$
\left\{\begin{array}{c}
\mathrm{S}^{\mathrm{R}}  \tag{16}\\
1
\end{array}\right\}_{17 \times 1}=\left[\mathrm{T}_{\mathrm{d}}\right]_{17 \times 17}\left\{\begin{array}{c}
\mathrm{s}^{\mathrm{L}} \\
1
\end{array}\right\}_{17 \times 1}
$$

## 4. TRANSFER MATRIX OF THE BEARING

From the force equilibrium, the relationship of the state variables between the left and right sides can be written as [1-5];

$$
\left\{\begin{array}{c}
\mathrm{S}^{\mathrm{R}}  \tag{17}\\
1
\end{array}\right\}_{17 \times 1}=\left[\mathrm{T}_{\mathrm{b}}\right]_{17 \times 17}\left\{\begin{array}{c}
\mathrm{S}^{\mathrm{L}} \\
1
\end{array}\right\}_{17 \times 1}
$$

## 5. OVERALL TRANSFER MATRIX

The overall transfer matrix of the rotor from one end to another can be written as;

$$
\begin{equation*}
\left\{\mathrm{S}_{\mathrm{n}}\right\}_{17 \times 1}=[\mathrm{U}]_{17 \times 17}\left\{\mathrm{~S}_{0}\right\}_{17 \times 1} \tag{18}
\end{equation*}
$$

where, $[\mathrm{U}]=\left[\mathrm{T}_{\mathrm{n}}\right]\left[\mathrm{T}_{\mathrm{bj}}\right]\left[\mathrm{T}_{\mathrm{n}-1}\right]\left[\mathrm{T}_{\mathrm{dj}}\right] \ldots \ldots . . .\left[\mathrm{T}_{\mathrm{db}}\right]\left[\mathrm{T}_{2}\right]\left[\mathrm{T}_{\mathrm{bi}}\right]\left[\mathrm{T}_{1}\right]\left\{\mathrm{S}_{0}\right\}$

## 6. SOLUTION ANALYSIS

Since the shear force and bending moments are zero at both the free ends of the shaft, Eq. (18) becomes;

$$
\left\{\begin{array}{c}
\mathrm{S}_{\mathrm{n}}^{\prime}  \tag{20}\\
0 \\
1
\end{array}\right\}=\left[\begin{array}{ccc}
{\left[\mathrm{U}_{11}\right]_{\mathrm{gx8}}} & {\left[\mathrm{U}_{12}\right]_{\mathrm{l} \times 8}} & {\left[\mathrm{U}_{1}\right]_{\mathrm{Bx1}}} \\
{\left[\mathrm{U}_{21}\right]_{\mathrm{8x} 8}} & {\left[\mathrm{U}_{22}\right]_{\mathrm{l} \times 8}} & {\left[\mathrm{U}_{2}\right]_{\mathrm{Bx1}}} \\
\{0\}_{8 \times 1} & \{0\}_{8 \times 1}^{\mathrm{t}} & 1
\end{array}\right]_{17 \times 17} \quad\left\{\begin{array}{c}
\mathrm{S}_{0}^{\prime} \\
0 \\
1
\end{array}\right\}
$$

where,

$$
S^{\prime}=\left\{x_{C}, X_{S}, Y_{C}, Y_{S}, \alpha_{C}, \alpha_{S}, \beta_{C}, \beta_{S}\right\}^{t}, \quad O=\{0,0,0,0,0,0,0,0\}
$$

By deleting all elements, which are related to moments and shear forces, it gives;

$$
\begin{equation*}
\left\{\mathrm{S}_{\mathrm{n}}^{\prime}\right\}_{8 \times 1}=\left[\mathrm{U}_{11}\right]_{8 \times 8}\left\{\mathrm{~S}_{0}^{\prime}\right\}+\left[\mathrm{U}_{1}\right]_{8 \times 1} \tag{21a}
\end{equation*}
$$

and $\left[\mathrm{U}_{21}\right]_{8 \times 8} \cdot\left\{\mathrm{~S}_{0}^{\prime}\right\}_{8 \times 1}+\left[\mathrm{U}_{2}\right]_{8 \times 1}=\{\mathrm{O}\}_{8 \times 1}$
Subscripts ' $O$ ' and ' $n$ ' are labelled for stages.
Eight simultaneous equations in Eq. (21b) are solved to obtain the eight state vectors $\left\{s_{0}^{\prime}\right\}_{8 \times 1}$.

$$
\left\{\mathrm{s}_{0}^{\prime}\right\}_{8 \times 1}=\left\{\mathrm{X}_{\mathrm{CO}}, \mathrm{X}_{\mathrm{SO}}, \mathrm{Y}_{\mathrm{CO}}, \mathrm{Y}_{\mathrm{SO}}, \alpha_{\mathrm{CO}}, \alpha_{\mathrm{SO}}, \beta_{\mathrm{CO}}, \beta_{\mathrm{SO}}\right\}^{\mathrm{t}}
$$

Then, the state vectors at any desired stage ( $\mathrm{p}^{\text {th }}$ stage) can be obtained by using Eq. (18) through matrix operation for the determination of dynamic response.

$$
\begin{equation*}
\left\{\mathrm{S}_{\mathrm{p}}\right\}_{17 \times 1}=\left[\mathrm{U}_{\mathrm{p}}\right]_{17 \times 17}\left\{\mathrm{~S}_{0}\right\}_{17 \times 1} \tag{22}
\end{equation*}
$$

where, $\quad\left\{\mathrm{S}_{0}\right\}_{17 \times 1}=\left\{\begin{array}{l}\left\{\mathrm{S}_{0}^{\prime}\right\}_{8 \times 1}^{\mathrm{t}}\end{array}\{\mathrm{O}\}_{8 \times 1}^{\mathrm{t}} \quad 1\right\}^{\mathrm{t}}$

## 7. FINITE ELEMENT ANALYSIS

A typical flexible rotor-bearing system consists of a rotor composed of discrete disks and rotor segments, and discrete elastic bearings as shown in Fig.4. Each rotor element is modelled as an eight degree of freedom element with two rotations and two translations at each end in each plane. The co-ordinates ( $\mathrm{q}_{\mathrm{i}}^{\mathrm{e}}, \mathrm{i}=1 \sim 8$ ) are the time-dependent and point displacements of the finite rotor element.

$$
\begin{equation*}
\left\{q_{i}^{\mathrm{e}}\right\}^{4 \mathrm{t}}=\left\{\mathrm{q}_{1}^{\mathrm{e}}, \mathrm{q}_{2}^{\mathrm{e}}, \mathrm{q}_{3}^{\mathrm{e}}, \mathrm{q}_{4}^{\mathrm{e}}, \mathrm{q}_{5}^{\mathrm{e}}, \mathrm{q}_{6}^{\mathrm{e}}, \mathrm{q}_{7}^{\mathrm{e}}, \mathrm{q}_{8}^{\mathrm{e} t}\right\}^{\mathrm{t}}=\left\{\mathrm{v}_{1}, \mathrm{w}_{1}, \theta_{1}, \phi_{1}, \mathrm{v}_{2}, \mathrm{w}_{2}, \theta_{2}, \phi_{2}\right\}^{\mathrm{t}} \tag{23}
\end{equation*}
$$

The Lagrangian equation of motion for the finite rotor element at the constant speed can be written as;

$$
\begin{equation*}
\left[M^{e}\right]\left\{\ddot{q}^{e}\right\}-\omega\left[G^{e}\right]\left\{\left\{q^{e}\right\}+\left[K^{e}\right]\left\{q^{e}\right\}=\left[F^{e}\right]\right. \tag{24}
\end{equation*}
$$

The Lagrangian equation of motion of the unbalanced rigid disk with gyroscopic effect at the constant angular speed can be written as;

$$
\begin{equation*}
\left\{\left[\mathrm{M}_{\mathrm{t}}^{\mathrm{d}}\right]+\left[\mathrm{M}_{\mathrm{r}}^{\mathrm{d}}\right]\right\}\left\{\mathrm{q}^{\mathrm{d}}\right\}-\omega\left[\mathrm{G}^{\mathrm{d}}\right]\left\{\mathrm{q}^{\mathrm{d}}\right\}=\left\{\mathrm{F}^{\mathrm{d}}\right\} \tag{25}
\end{equation*}
$$

where, $\left\{\mathrm{F}^{\mathrm{d}}\right\}=\left[\mathrm{F}_{\mathrm{s}}^{\mathrm{d}}\right] \sin \omega \mathrm{t}+\left[\mathrm{F}_{\mathrm{c}}^{\mathrm{d}}\right] \cos \omega \mathrm{t}=\left\{\begin{array}{c}-\mathrm{u}_{\mathrm{z}}^{\mathrm{d}} \omega^{2} \\ \mathrm{u}_{\mathrm{y}}^{\mathrm{d}} \omega^{2} \\ 0 \\ 0\end{array}\right\} \sin \omega \mathrm{t}+\left\{\begin{array}{c}-\mathrm{u}_{\mathrm{y}}^{\mathrm{d}} \omega^{2} \\ \mathrm{u}_{\mathrm{z}}^{\mathrm{d}} \omega^{2} \\ 0 \\ 0\end{array}\right\} \cos \omega \mathrm{t}$

$$
u_{z}^{d}=m_{i} \cdot e_{i} \sin \beta, \quad u_{y}^{d}=m_{i} \cdot e_{i} \cos \beta
$$

The governing equation of the bearing can be written as;
$[\mathrm{O}]\left\{\ddot{\mathrm{q}}^{\mathrm{b}}\right\}+\left[\mathrm{C}^{\mathrm{b}}\right]\left\{\dot{\mathrm{q}}^{\mathrm{b}}\right\}+\left[\mathrm{K}^{\mathrm{b}}\right]\left\{\mathrm{q}^{\mathrm{b}}\right\}=\left\{\mathrm{F}^{\mathrm{b}}\right\}$
or $\left[\begin{array}{ll}C_{x x} & C_{x y} \\ C_{y x} & C_{y y}\end{array}\right]\left\{\begin{array}{l}\dot{v}^{b} \\ \dot{w}^{b}\end{array}\right\}+\left[\begin{array}{cc}K_{x x} & K_{x y} \\ K_{y x} & K_{y y}\end{array}\right]\left\{\begin{array}{c}v^{b} \\ w^{b}\end{array}\right\}=\left\{\begin{array}{l}\left.F^{b}\right\}\end{array}\right.$
The assembled undamped system equation is of the form :
$\left[M^{s}\right]\left\{q^{s}\right\}+\left\{-\omega\left[G^{s}\right]+\left[C^{s}\right]\right\}\left\{q^{s}\right\}+\left[K^{s}\right]\left\{q^{s}\right\}=\left[F^{s}\right]$
The steady state solution is
$\left\{q^{s}\right\}=\left\{q_{c}^{s}\right\} \cos \omega t+\left\{q_{s}^{s}\right\} \sin \omega t$
Differentiating any separating cosine and sine terms, it yields

Then

$$
\left\{\begin{array}{l}
\left\{q_{c}^{s}\right\}  \tag{30}\\
\left\{q_{s}^{s}\right\}
\end{array}\right\}=\left[\begin{array}{cc}
\left(\left[\mathrm{K}^{s}\right]-\omega^{2}\left[\mathrm{M}^{s}\right]\right) & \omega^{2}\left(\left[\mathrm{C}^{\mathrm{s}}\right]-\left[\mathrm{G}^{\mathrm{s}}\right]\right) \\
-\omega^{2}\left(\left[\mathrm{C}^{\mathrm{s}}\right]-\left[\mathrm{G}^{\mathrm{s}}\right]\right) & \left(\left[\mathrm{K}^{\mathrm{s}}\right]-\omega^{2}\left[\mathrm{M}^{\mathrm{s}}\right]\right)
\end{array}\right]^{-1}\left\{\begin{array}{c}
\left\{\mathrm{F}_{\mathrm{c}}^{\mathrm{s}}\right\} \\
\left\{\mathrm{F}_{\mathrm{s}}^{\mathrm{s}}\right\}
\end{array}\right\}
$$

The solution of Eq.(30) provides $\left\{q_{c}^{s}\right\}$ and $\left\{q_{s}^{s}\right\}$ and back substitution in Eq.(28) determines the unbalance response of the rotor system at the required position.

## 8. NUMERICAL ANALYSIS

In order to illustrate the accuracy of the theoretical analysis, a three disks rotor system mounted on fluid-film bearing is considered as physical model as shown in Fig. 5 [disk mass $\left(\mathrm{M}^{\mathrm{d}}\right)=13.47 \mathrm{~kg}$, polar mass moment of inertia $\left(\mathrm{I}_{\mathrm{p}}^{\mathrm{d}}\right)=1.02 \times 10^{-1} \mathrm{~kg} \mathrm{~m}^{2}$, transverse mass moment of inertia $\left(\mathrm{I}_{\mathrm{T}}^{\mathrm{d}}\right)=5.11 \times 10^{-2} \mathrm{~kg} \mathrm{~m}^{2}$, direct stiffness coefficients $\left(\mathrm{K}_{\mathrm{xx}}=\mathrm{K}_{\mathrm{yy}}\right)=1 \times 10^{7}$ $\mathrm{N} / \mathrm{m}$, cross-coupled stiffness coefficients $\left(\mathrm{K}_{\mathrm{yx}}=\mathrm{K}_{\mathrm{xy}}\right)=5 \times 10^{6} \mathrm{~N} / \mathrm{m}$, direct damping and cross damping coefficients are $\mathrm{C}_{\mathrm{xx}}=\mathrm{C}_{\mathrm{yy}}=2 \times 10^{3} \mathrm{~N} / \mathrm{m} / \mathrm{sec}, \mathrm{C}_{\mathrm{xy}}=\mathrm{C}_{\mathrm{yx}}=0$, respectively].

Two cases are considered in the numerical analysis.
Case-1 : Bearing without damping ( $\mathrm{K}_{\mathrm{xx}}, \mathrm{K}_{\mathrm{xy}}, \mathrm{K}_{\mathrm{yy}}, \mathrm{K}_{\mathrm{yx}}$ )
Case-2 : Bearing with stiffness and damping ( $\mathrm{K}_{\mathrm{xx}}, \mathrm{K}_{\mathrm{xy}}, \mathrm{K}_{\mathrm{yy}}, \mathrm{K}_{\mathrm{yx}}, \mathrm{C}_{\mathrm{xx}}, \mathrm{C}_{\mathrm{yy}}$ )

## 9. DISCUSSION \& CONCLUSION

The amplitudes of response are calculated by the absolute values of the major axis of the elliptical orbits. The calculated dynamic responses at disk-1 are plotted as solid curves in Figs. 6 \& 7 for the first natural mode region based on modified transfer matrix method. The dashed curves are calculated from the finite element method by six elements. It is shown that two curves for both the cases are close to each other. The cross-stiffness make the critical speed split into two values for its asymmetry, as evaluated in case- 2 at 44.83 Hz and 51.82 Hz . The critical speed can be located from the maximum response peak of the frequency response curve. For asymmetrical bearing due to cross-stiffness and damping, the whiling orbit becomes elliptical rather than circular. Synchronous response due to unbalance mass and non-synchronous response due to the journal motion with frequency being three times of the rotating speed is considered $(\Omega=3 \omega)$ and the numerical results are produced in Figs. 8 \& 9 .

The modified general transfer matrix method is a versatile technique for the determination of dynamic characteristics of any rotor-bearing system considering various influencing parameters related to rotor, disk and bearings in the frequency domain.
